

# Windbreak/Shelterbelt Establishment

## Conservation Practice Job Sheet

**380**

*Instructor Solution for Doug and Kathy Fir, CMU HQ*

### Definition

Windbreaks or shelterbelts are plantings of single or multiple rows of trees or shrubs that are established for environmental purposes. Living snowfences are an important variation of windbreaks and shelterbelts in some parts of the country. The height of the tallest row and overall density of foliage and branches of an individual windbreak/shelterbelt planting greatly influence the size of the nearby area that is protected or sheltered.

### Purpose

Windbreaks or shelterbelts are generally established to protect or shelter nearby, leeward areas from troublesome winds. Such plantings are used to reduce wind erosion, protect growing plants (crops and forage), alter microenvironment to enhance plant growth, manage snow, improve irrigation efficiency, and delineate field boundaries. Windbreaks also protect structures and livestock, provide wildlife habitat and travel corridors, enhance aesthetics, and

increase carbon storage. Also, when used as a living screen, windbreaks control views, reduce noise, and intercept chemical drift.

### Where used

Windbreaks are “environmental buffers” that are planted in a variety of settings, such as on cropland, pasture, and rangeland (sometimes referred to as “living barns”); along roads, farmsteads, feedlots; and in urban areas.

### Resource management system

Windbreaks and shelterbelts are normally established concurrently with other practices as part of a resource management system for a conservation management unit. For example, conservation crop rotation, residue management, and windbreaks can act together to control wind erosion year-round.

A windbreak or shelterbelt usually consists of multiple rows, with shrubs in the outer rows and taller trees in the interior. Complementary practices work with these environmental buffers to further control wind erosion and snow deposition and modify site characteristics for habitat and screening purposes. For comprehensive protection of a field, windbreaks are placed in a series across the area (typically spaced at intervals of 5 to 20 times the height of each windbreak), with individual windbreaks running parallel to one another, but perpendicular to prevailing winds.

## Wildlife

For plantings to function properly, access by livestock and certain wildlife must be managed year-round (use exclusion and fencing). Connecting shelterbelts with existing or planned perennial vegetation, such as woodlots and woody draws (tree/shrub establishment) or riparian areas (riparian forest buffer), provides additional benefits for wildlife and aesthetics. Select native or adapted species that provide wildlife food or cover.

## Operation and maintenance

Trees and shrubs in a windbreak or shelterbelt need periodic maintenance and, later on, possible renovation (tree/shrub pruning and windbreak/shelterbelt renovation). In arid areas windbreaks may need supplemental water or the use of water-harvesting techniques for successful establishment.

## Specifications

Site-specific requirements are listed on the specifications sheet. Additional provisions are entered on the job sketch sheet. Specifications are prepared in accordance with the NRCS Field Office Technical Guide. See practice standard Windbreak/ Shelterbelt Establishment, code 380.

This multiple-row windbreak protects the adjacent farmstead and provides important wildlife habitat.

## Windbreak/Shelterbelt Establishment – Job Sheet

Landowner Doug and Kathy Fir

Field number HQ

Purpose (those that don't apply are lined out)	
<input type="checkbox"/> Reduce soil erosion from wind	<input type="checkbox"/> Provide living noise screens
<input checked="" type="checkbox"/> <del>Protect plants from wind-related damage</del>	<input type="checkbox"/> Provide living visual screens
<input type="checkbox"/> Alter microenvironment for enhancing plant growth	<input type="checkbox"/> Provide living barriers against airborne chemical drift
<input type="checkbox"/> Manage snow deposition	<input checked="" type="checkbox"/> <del>Delineate property and field boundaries</del>
<input type="checkbox"/> Provide shelter for structures, livestock, and recreational areas	<input checked="" type="checkbox"/> <del>Improve irrigation efficiency</del>
<input checked="" type="checkbox"/> <del>Enhance wildlife habitat by providing travel corridors</del>	<input type="checkbox"/> Enhance aesthetics
	<input type="checkbox"/> Increase carbon storage

Location and Layout (See diagram next page.)	
Width (feet; include widths of maintenance areas next to outer rows): <b>3-row = 45'; Twin = 20'; Single = 20'.</b>	
Length (feet): <b>3-row = 325'; Twin = 300'; Single = 60'.</b>	Area (acres): <b>0.5</b>
Total area of zone protected/sheltered (acres; based on expected height and density of the windbreak/shelterbelt): <b>4</b>	
Additional requirements: <b>A single 4' high wooden slat snowfence 350' long will be immediately installed to control drifts on county road and drive way; permission given by adjacent landowner.</b>	

Woody Plant Materials Information					
Species/cultivar by row number:	Kind of stock <sup>1</sup> :	Planting Dates	Distance between plants within row (ft):	Total number of plants for row:	Distance (ft) from this row to next row <sup>2</sup> :
1 3-row, Row 1 (windward) = shrubD	BA	Mar 15-30	3	110	15
2 3-row, Row 2 = treeE	CO	Mar 15-30	12	30	15
3 3-row, Row 3 = treeB	CO	Mar 15-30	8	45	--
4 Twin-row, Row 1 (windward) = shrubC	BA	Mar 15-30	3	100	4
5 Twin-row, Row 2 = shrubC	BA	Mar 15-30	3	100	--
6 Single-row = treeE	CO	Mar 15-30	12	5	--
7					--

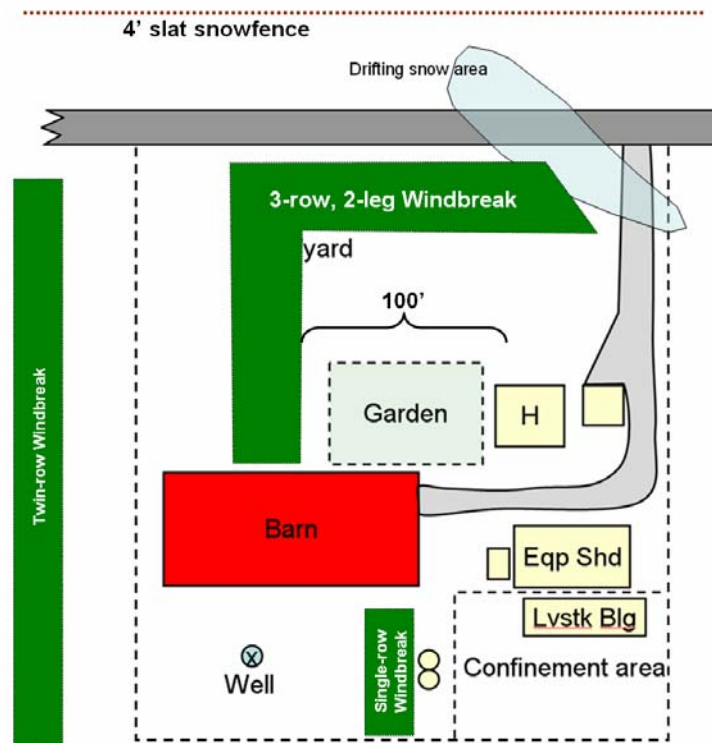

<sup>1</sup>BA:bareroot, CO:container, CU:cutting; include size, caliper, height, and age as applicable. <sup>2</sup>Adjusted for width of maintenance equipment.

Temporary Storage Instructions
Planting stock that is dormant or containerized may be stored temporarily in a cooler or protected area. For bareroot stock that is expected to begin growth before planting, dig a V-shaped trench (heeling-in-bed) sufficiently deep and bury seedlings so that all roots are covered by soil. Pack the soil firmly and water thoroughly. Additional requirements: <b>Inspect for environmental and pest damage before storage and again before planting.</b>
Site Preparation
Chemically kill lawn grasses and weeds in a 5' width/row per label instructions using herbicide recommended by local extension agent. For twin-row windbreak, fall till the 20' x 300' planting area the year before planting, then lightly till and culti-pack 2-3 weeks before planting.
Planting Methods
For container and bareroot stock, plant stock to a depth even with the root collar in holes deep and wide enough to fully extend the roots. Pack the soil firmly around each plant. Additional requirements: <b>Mark the twin-row planting with stakes to be visible during farm operations during the first 2 years.</b>
Operation and Maintenance
Inspect windbreak/shelterbelt components periodically and protect from damage so proper function is maintained. Replace dead or dying tree/shrub stock and continue control of competing vegetation to allow proper establishment. Install and begin supplemental irrigation if required. Additional requirements: <b>Place plant protective tubing on all stock to minimize deer damage; maintain until plants 'outgrow' deer browsing. If this is insufficient, deer-proof fencing may be needed around the HQ unit. Lightly cultivate on outside areas of twin-row to remove weed growth as needed. Mow grasses and weed growth near and within 3-row and single-row windbreaks as needed. Reapply herbicide as needed immediately surrounding plant if necessary (protect plants from direct spray).</b>

## Windbreak/Shelterbelt Establishment – Job Sheet

If needed, an aerial view or a side view of the practice can be shown below. Other relevant information, complementary practices and measures, and additional specifications may be included.

Scale 1"= 100 ft.

Note: Winds are from the northwest.

Additional Specifications and Notes:
<i>Consider replacement of slat snowfence with living snowfence if possible.</i>
<i>Set-back of 3-row windbreak from county road (including ends of rows near driveway)</i>
<i>for visibility/safety purposes.</i>
<i>Set-back of single-row windbreak from barn for maintenance vehicles to service areas</i>
<i>southwest and northwest of the barn. (Note: Barn is 35' in height.)</i>
<i>South end of 3-row windbreak planted close to barn to prevent "wind gap" from northwest winds.</i>
